

E-Commerce Revenue Intelligence

Power BI — DAX Measures Documentation

Portfolio reference for the E-Commerce Revenue Intelligence dashboard.

Total Revenue

```
Total Revenue =  
SUMX('Online Retail', 'Online Retail'[Quantity] * 'Online Retail'[Price])
```

Purpose: Calculates transaction-level revenue.

Total Orders

```
Total Orders =  
DISTINCTCOUNT('Online Retail'[Invoice])
```

Purpose: Counts unique invoices/orders.

Total Customers

```
Total Customers =  
DISTINCTCOUNT('Online Retail'[Customer ID])
```

Purpose: Counts unique customers.

Average Order Value

```
AOV =  
DIVIDE([Total Revenue], [Total Orders], 0)
```

Purpose: Calculates average revenue per order.

Repeat Customers

```
Repeat Customers =  
COUNTROWS(FILTER(VALUES('Online Retail'[Customer ID]), CALCULATE(DISTINCTCOUNT('Online Retail'[Invoice])) >  
1))
```

Purpose: Identifies customers with more than one order.

Repeat Customer Rate

```
Repeat Customer Rate =  
DIVIDE([Repeat Customers], [Total Customers], 0)
```

Purpose: Calculates repeat-customer percentage.

Revenue Contribution %

```
Revenue Contribution % =  
DIVIDE([Total Revenue], CALCULATE([Total Revenue], ALL('Online Retail')), 0)
```

Purpose: Compares selected revenue against overall revenue.

Revenue Z-Score

```
Revenue Z-Score =  
DIVIDE([Daily Revenue] - [Average Daily Revenue], [Revenue Standard Deviation], 0)
```

Purpose: Standardizes daily revenue for anomaly analysis.

Anomaly Flag

```
Anomaly Flag =  
IF(ABS([Revenue Z-Score]) >= 3, "Anomaly", "Normal")
```

Purpose: Flags unusually high/low revenue observations.

DAX Concepts Demonstrated

SUMX / SUM — Revenue aggregation

DISTINCTCOUNT — Orders and customer counting

DIVIDE — KPI and percentage calculations

CALCULATE — Filter/context modification

FILTER — Customer-level filtering

VALUES — Unique customer context

ALL — Overall revenue comparison

IF — Anomaly classification

Note: Verify table/column names against the final PBIX before describing these as an exact exported copy of the model.
